User Interface

Thermostat

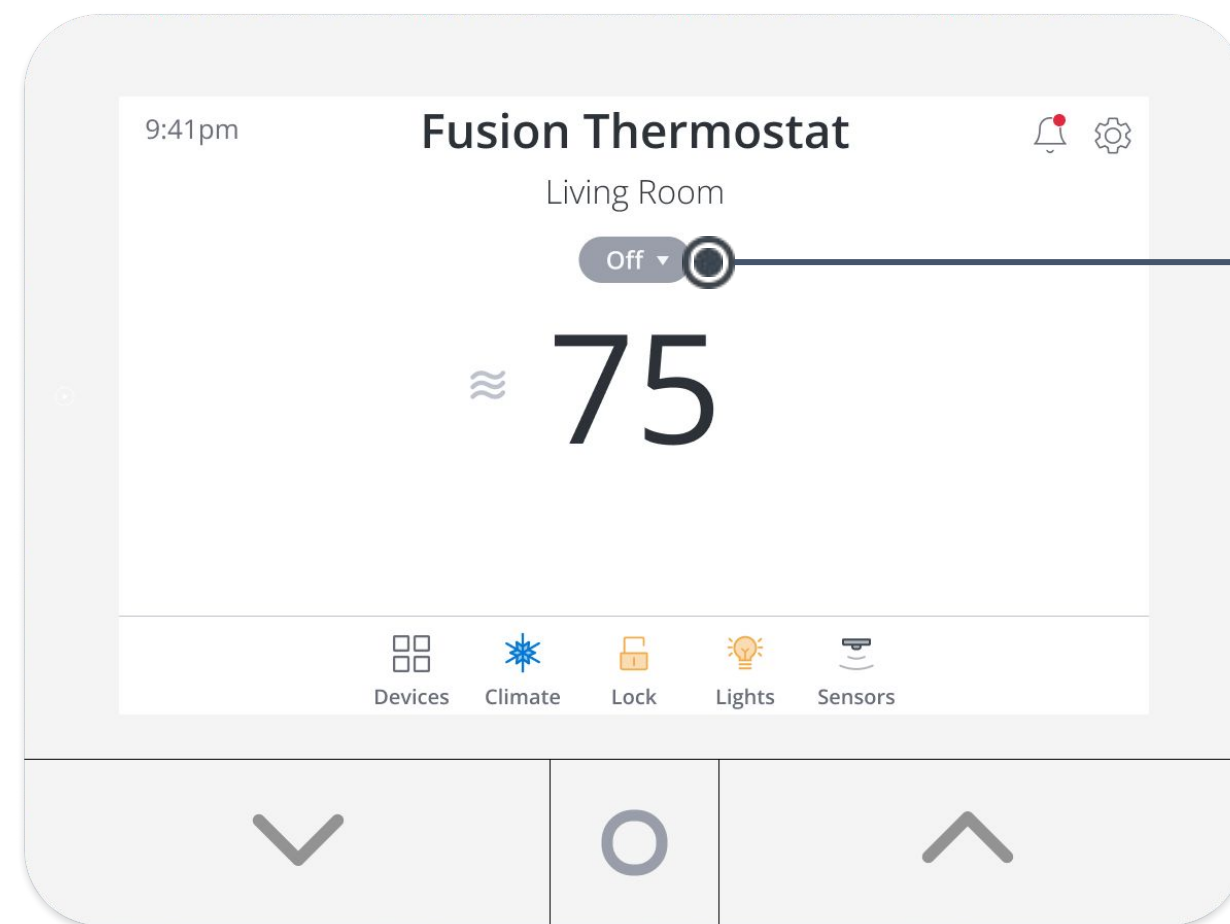

Cooling mode, in off state

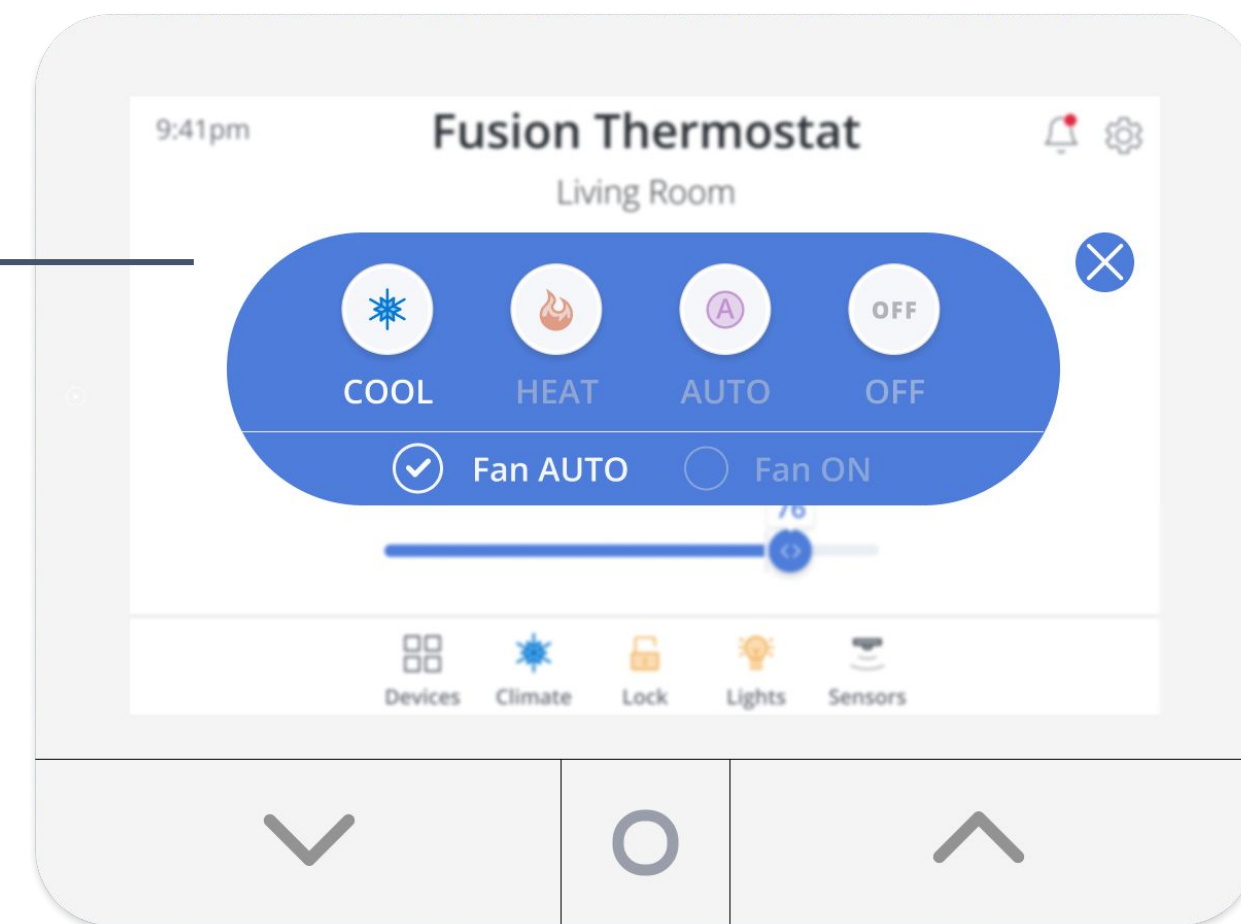

Cooling mode in running state

Options

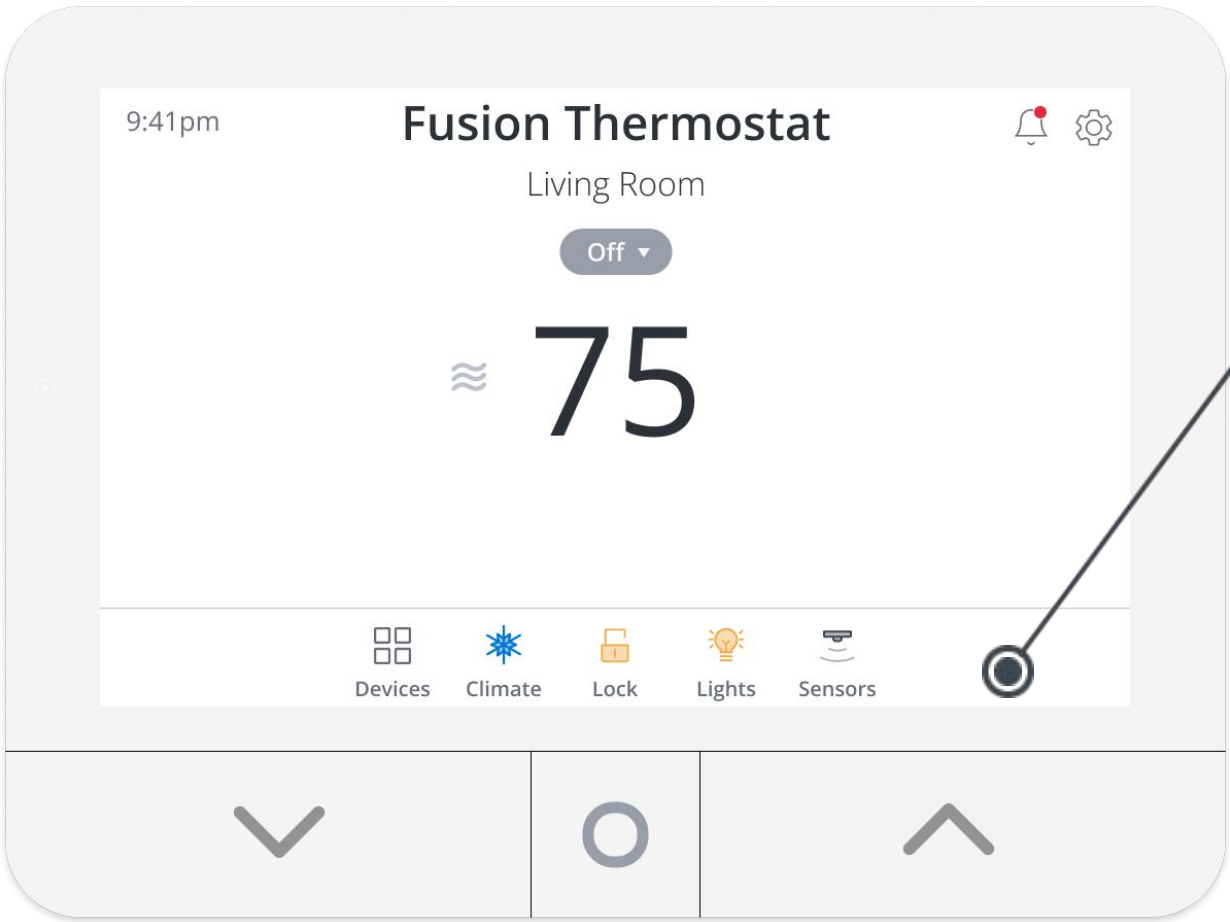

When a user wishes to change the mode or fan, they can tap the pill button which will show the current state in the collapse view.

This feature animates to expand to show these options and functions like a modal. Any tap outside of the active region will close this modal. The modal will also close when a user makes a new selection or taps the (X).

Navigation

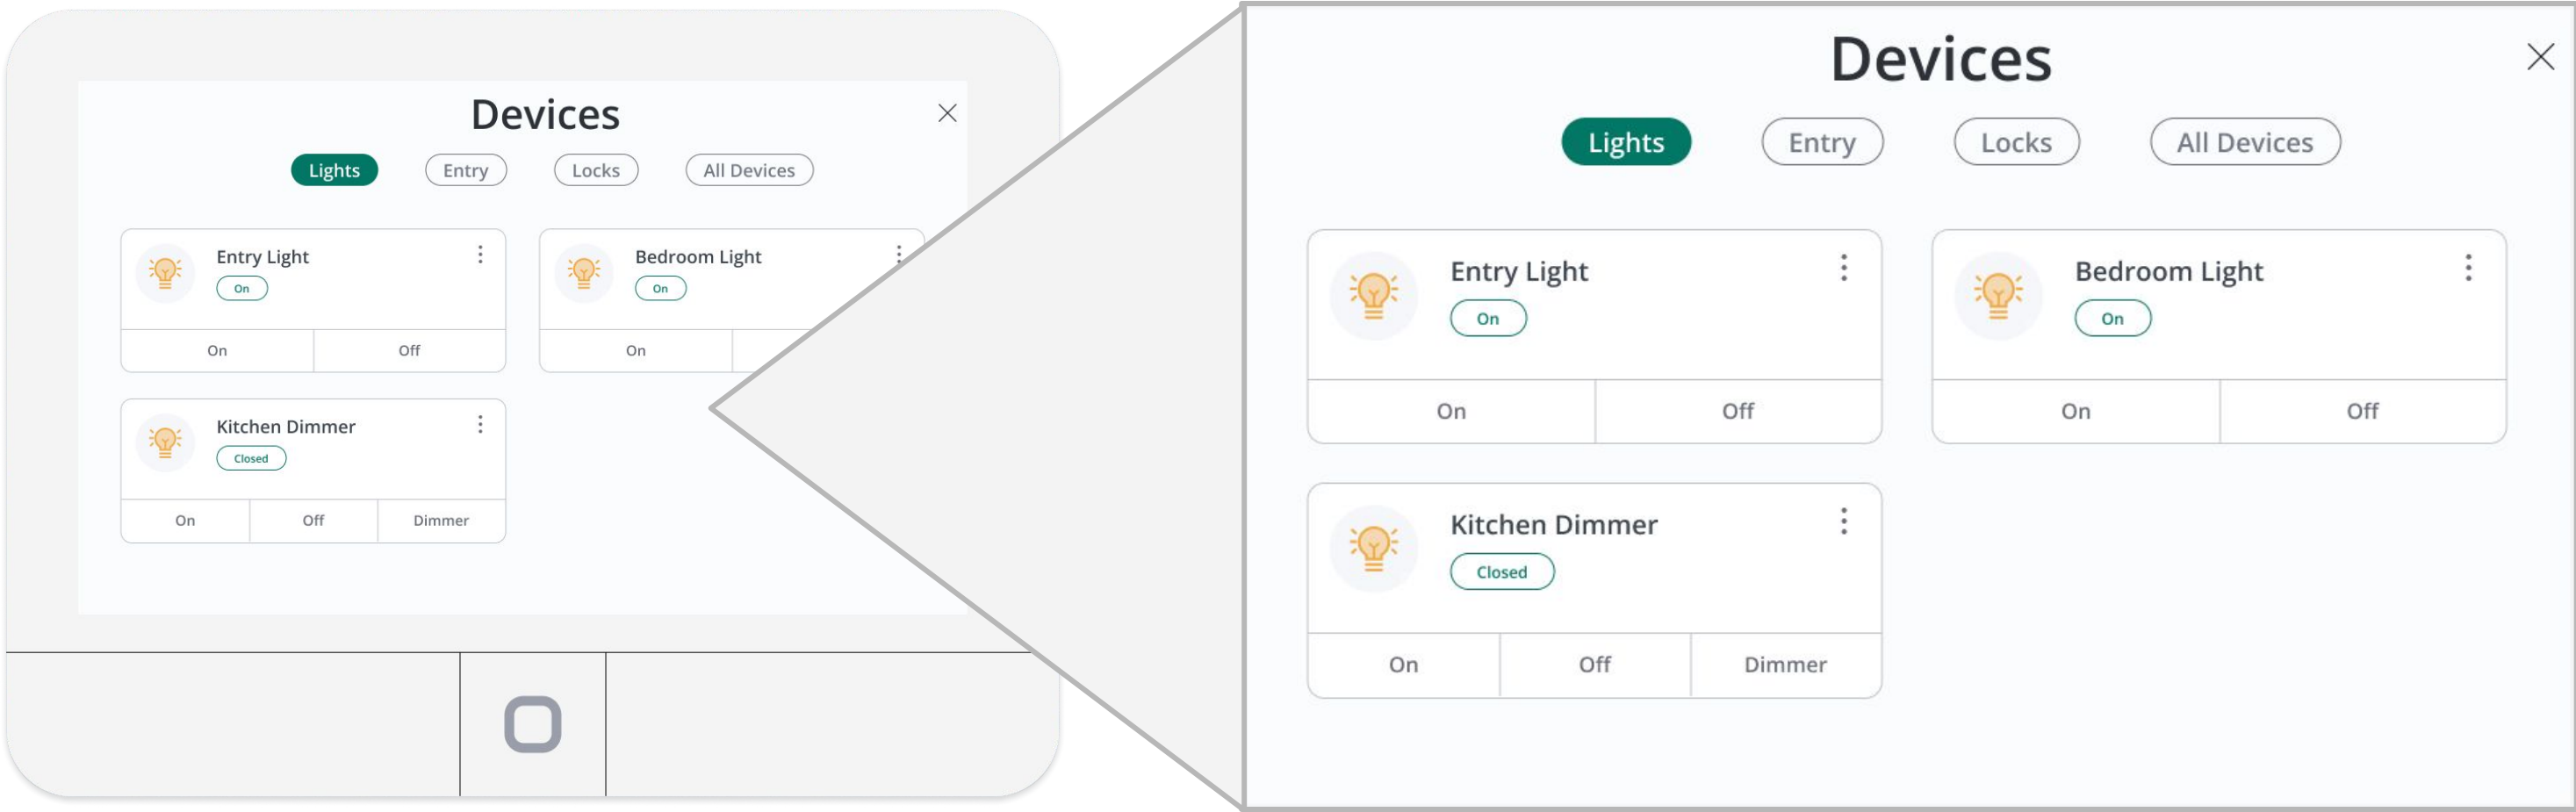

Navigation items are a lead to the device details page of a device or to the all devices grid with the device type filter selected if grouped

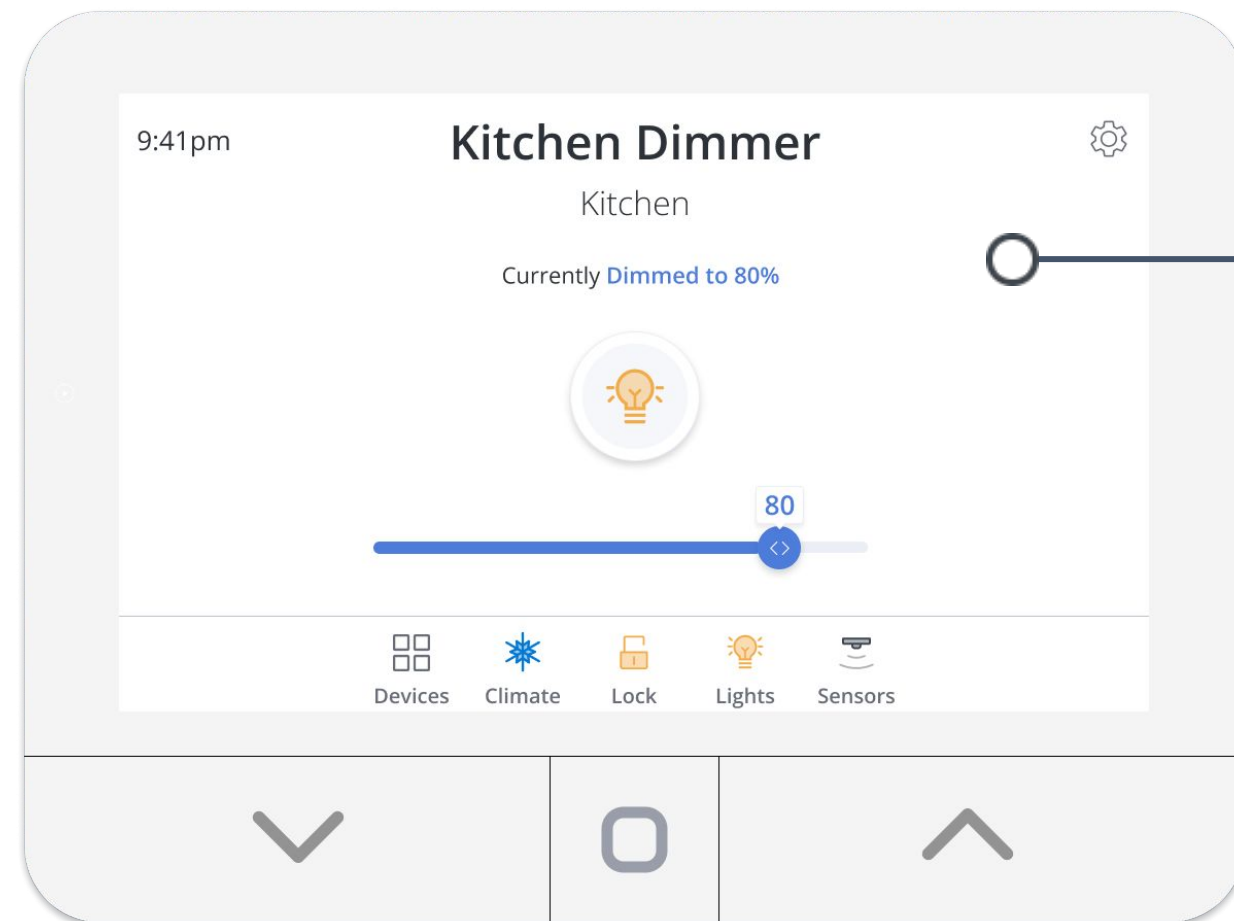

In deployments with less than 5 devices, we won't need grouping

Device List

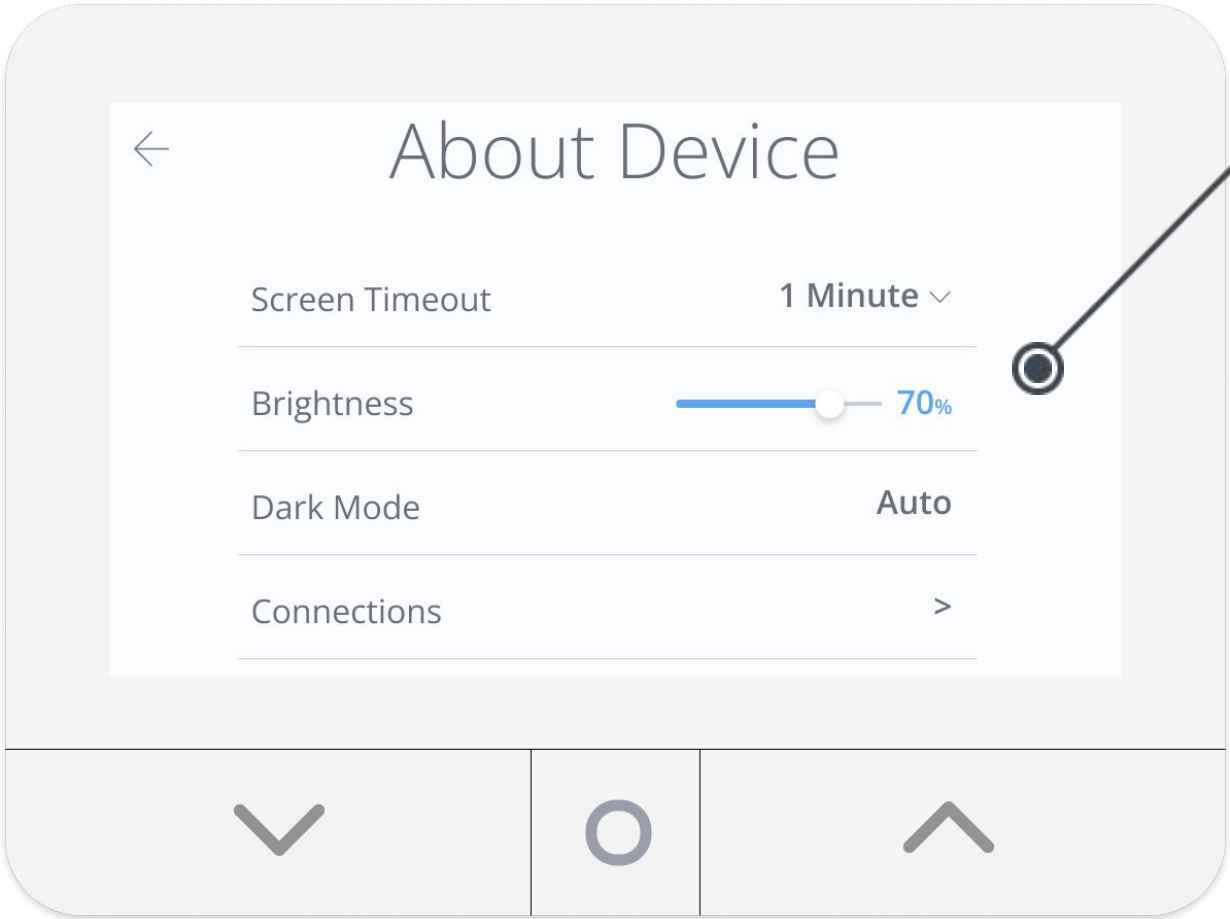

Devices List shows a list of all devices with filters at the top. The filters can allow users to view All Devices or only that type of device and could later add rooms

Device Details

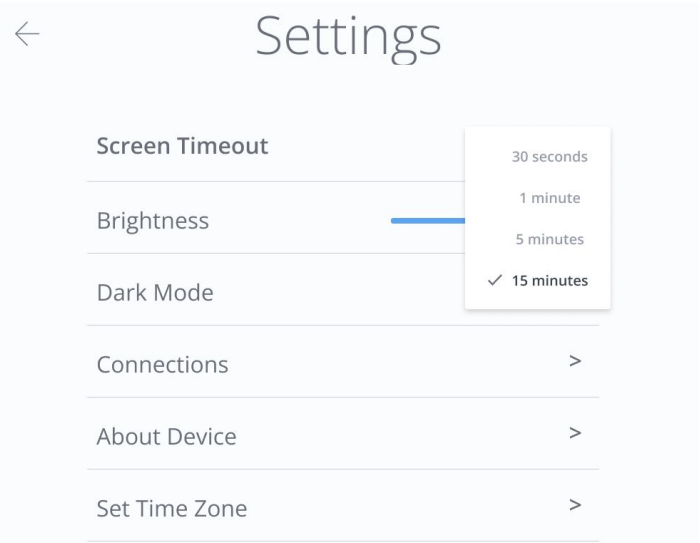

This is a full screen representation of a device. Users can reach this view via the bottom navigation bar if there is only one device of that type, or they can click on a device card to navigate to this page. We also intend to provide a swipe gesture to move between navigation items.

Settings

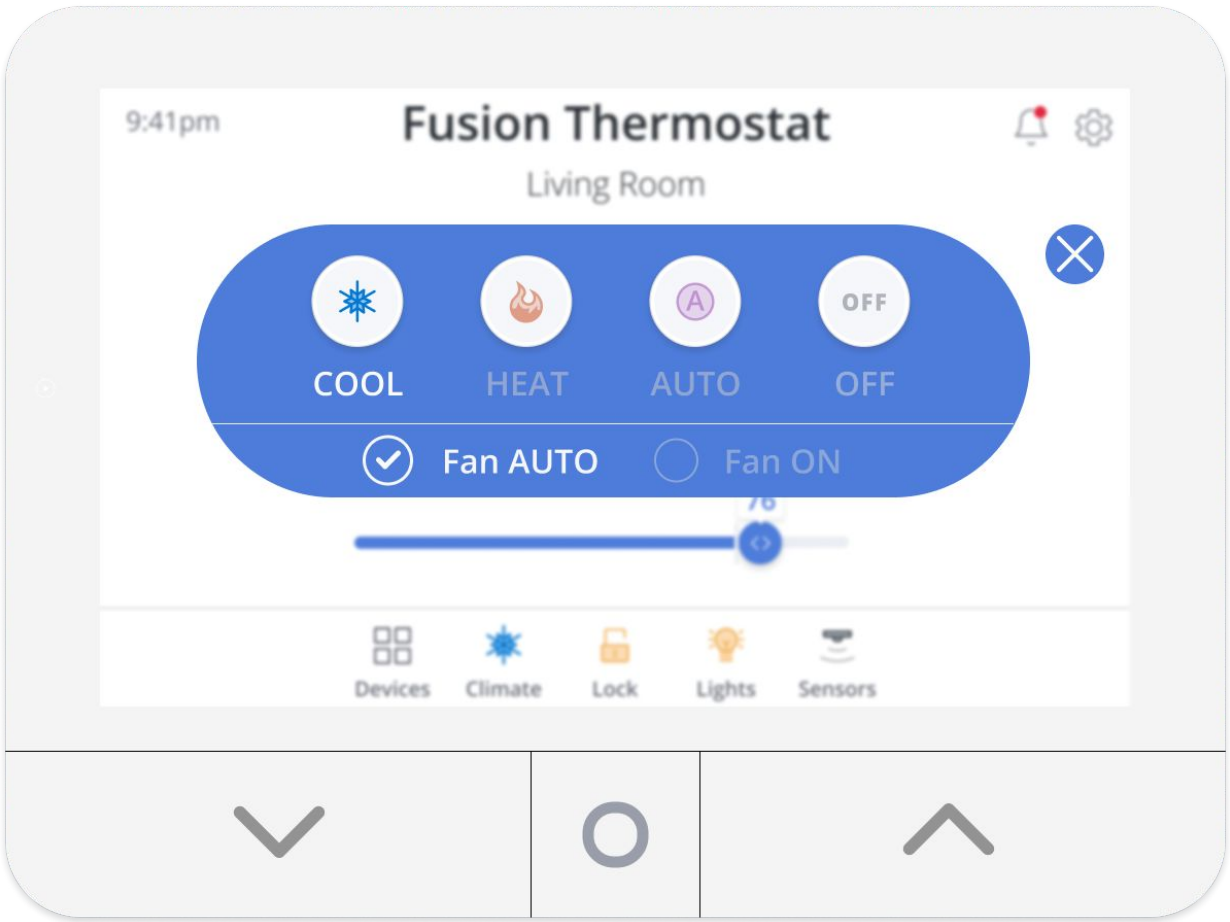

Settings will follow this pattern for additional settings like, ethernet, wifi, cellular setup screen time out is a drop down when tapped which expands to show more options such as 1,5,15, 30 or 1 hour

Overflow information is accessible via a vertical scroll

Dark Mode
